

Smart Fitness Tracker System

1. Introduction

This project is a simple Java-based application designed to track fitness activities and monitor user health data.

2. Problem Statement

Maintaining fitness records manually is difficult and inefficient. This system helps track workouts and analyze performance easily.

3. Objectives

- Store user fitness data
- Track workouts and calories burned
- Display progress
- Improve fitness monitoring

4. Methodology

The system uses Object-Oriented Programming concepts. Classes such as User, Workout, and FitnessTracker are used to organize data.

5. OOP Concepts Used

- Class and Object
- Encapsulation
- Methods and Functions

6. Results

The program successfully tracks workouts and displays fitness information clearly.

7. Conclusion

This project demonstrates how Java OOP concepts can be used to build a simple and useful fitness tracking system.
